

SSH Log Analysis

Splunk Basics – SSH Log Analysis

STEP-BY-STEP LAB REPORT

OBJECTIVE

The objective of this lab is to learn how **SSH authentication logs can be analyzed using Splunk** to detect suspicious login activity.

In this lab we will:

- Upload **Zeek-style SSH logs** into Splunk.
- Analyze SSH authentication attempts.
- Detect **failed login attempts and successful connections**.
- Identify **possible brute force attacks or unauthorized access**.

SSH log monitoring is important because attackers often attempt to **gain access to servers using repeated login attempts**.

TOOLS AND ENVIRONMENT

Component	Description
Splunk	Log management and data analysis platform
Log Source	Zeek SSH logs
File Format	JSON
Index Used	ssh_lab
Sourcetype	json

LAB SETUP

Before performing the analysis, the SSH log file must be uploaded to Splunk.

Step 1 – Open Splunk Web

1. Open **Splunk Web Interface** in your browser.
2. Log in using your credentials.

Step 2 – Navigate to Add Data

1. Go to:

Settings → Add Data

2. Select **Upload**.

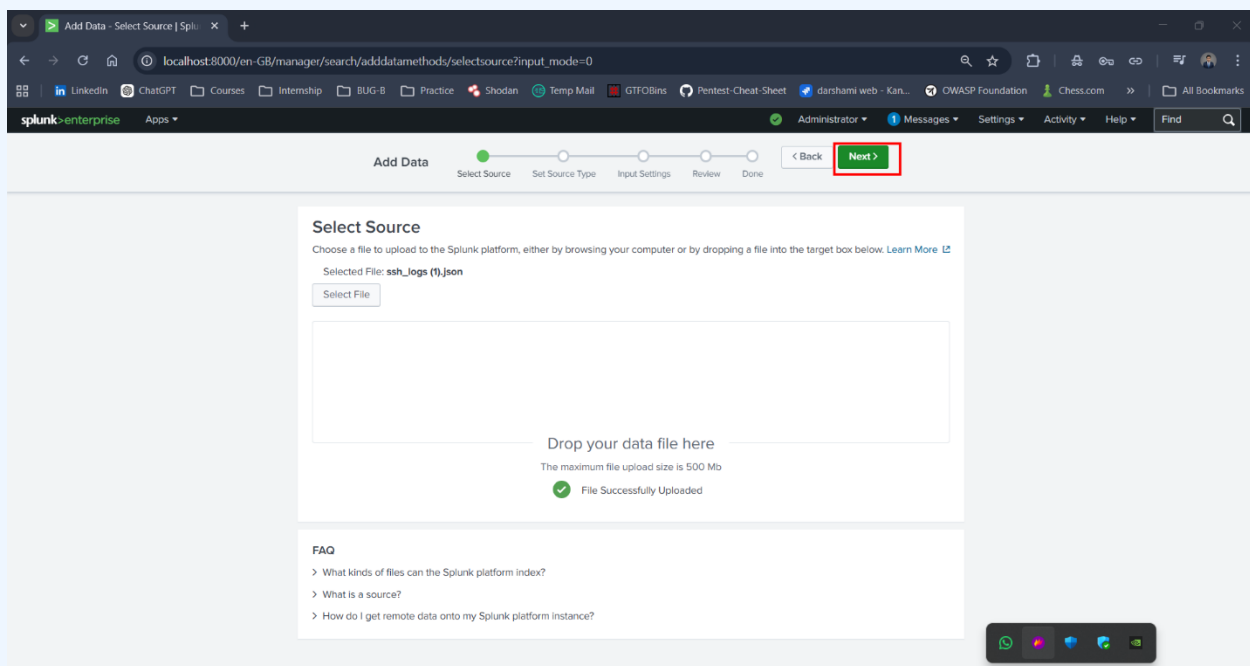

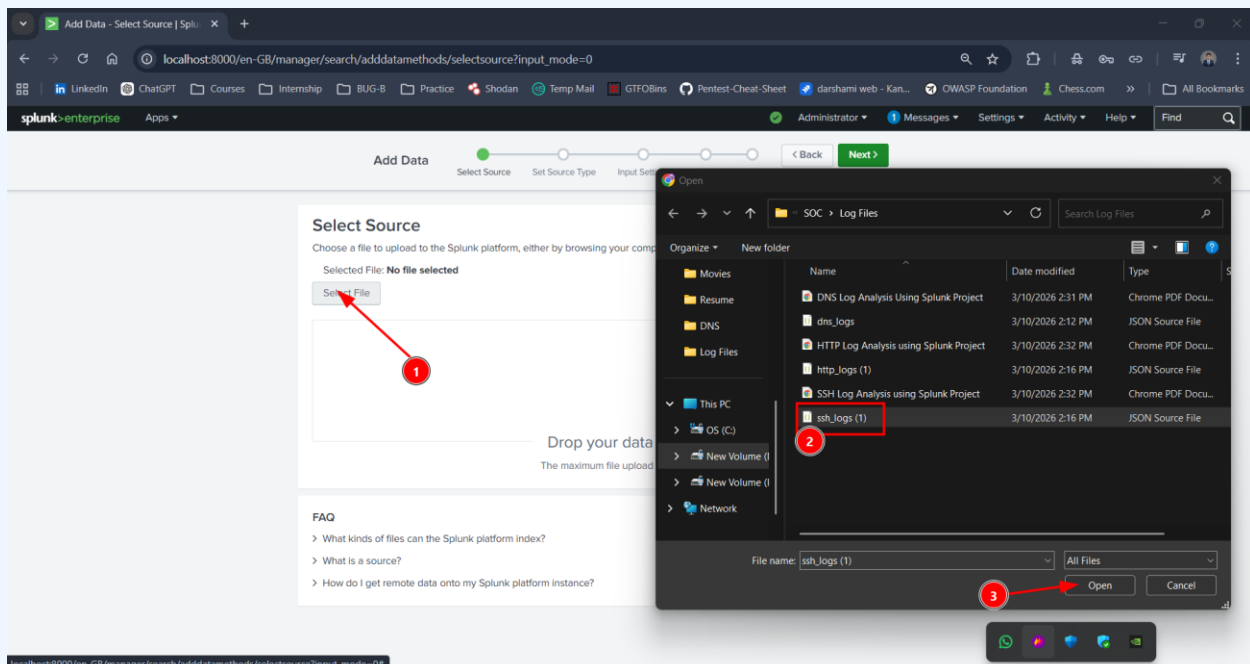

Step 3 – Upload the SSH Log File

1. Click **Select File**
2. Upload the file:

`ssh_logs`

This file contains **SSH connection events captured in Zeek-style format**.

Step 4 – Configure Source Type

Set the source type as:

`_json`

or create a custom sourcetype:

`ssh_logs`

Reason:

- The log file is structured in **JSON format**.
- Splunk automatically extracts fields such as:
 - `id.orig_h`
 - `auth_success`
 - `event_type`
 - `timestamp`

The screenshot shows the 'Set Source Type' page in Splunk. The source is 'ssh_logs (t).json'. The 'Source type' dropdown is set to '_json'. Below this, there is a table of events with columns: _time, auth_attempts, auth_success, conn_state, event_type, history, id.orig_h, id.orig_p, id.resp_h, id.resp_p, and missed_bytes. The table contains 7 rows of data. A red box highlights the 'Source type: _json' dropdown, and a red arrow points to the 'Next >' button in the top navigation bar.

	_time	auth_attempts	auth_success	conn_state	event_type	history	id.orig_h	id.orig_p	id.resp_h	id.resp_p	missed_bytes
1	24/04/2025 15:50:09.508	1	true	SF	Successful SSH Login	ShADadFF	10.0.0.43	58221	10.0.1.6	22	0
2	24/04/2025 15:50:09.508	1	false	SF	Failed SSH Login	ShADadFF	10.0.0.36	26957	10.0.1.12	22	0
3	24/04/2025 15:50:09.508	8	false	SF	Multiple Failed Authentication Attempts	ShADadFF	10.0.0.44	42848	10.0.1.10	22	0
4	24/04/2025 15:50:09.508	1	false	SF	Failed SSH Login	ShADadFF	10.0.0.20	47789	10.0.1.2	22	0
5	24/04/2025 15:50:09.508	1	true	SF	Successful SSH Login	ShADadFF	10.0.0.37	30192	10.0.1.1	22	0
6	24/04/2025 15:50:09.508	6	false	SF	Multiple Failed Authentication Attempts	ShADadFF	10.0.0.42	32500	10.0.1.10	22	0
7	24/04/2025	0	null	SF	Connection	ShADadFF	10.0.0.10	47980			

Step 5 – Configure Index

Create or select an index:

`ssh_lab`

Reason:

- Keeps SSH lab data separated from other datasets.
- Makes analysis easier.

Step 6 – Complete Upload

1. Review settings.
2. Click **Submit**.
3. Splunk will ingest and index the data.

To confirm indexing run:

```
index=ssh_lab
```

If events appear, the data upload was successful.

UNDERSTANDING SSH LOGS

SSH logs record **authentication attempts and connections to servers**.

Common fields in Zeek SSH logs:

Field	Description
id.orig_h	Source IP attempting SSH connection
id.resp_h	Destination server IP
auth_success	Indicates whether authentication succeeded
event_type	Type of SSH event
timestamp	Time of the event

Example SSH Log Event

```
{
  "id.orig_h": "192.168.1.10",
  "id.resp_h": "192.168.1.5",
  "auth_success": false,
  "event_type": "failed"
}
```

LAB TASKS

Task 1: List Top 10 Endpoints with Failed SSH Login Attempts

SPL Query

```
index=ssh_lab sourcetype="json" auth_success=false
| stats count by "id.orig_h"
| sort -count
| head 10
```

Explanation

Command	Purpose
<code>index=ssh_lab</code>	Searches logs in ssh_lab index
<code>sourcetype="json"</code>	Filters JSON formatted logs
<code>auth_success=false</code>	Shows only failed login attempts
<code>stats count by id.orig_h</code>	Counts failed attempts by source IP
<code>sort -count</code>	Sorts results in descending order
<code>head 10</code>	Displays top 10 IP addresses

Security Insight

This query helps detect:

- **Brute force attacks**
- IPs attempting repeated SSH logins
- Suspicious external access attempts

The screenshot shows the Splunk Search interface with the following query in the search bar:

```
source="ssh_logs" (1).json" sourcetype="json" auth_success=false | stats count by "id.orig_h" | sort -count | head 10
```

The search results show 608 events. The results are displayed in a table with two columns: `id.orig_h` and `count`. The top 10 results are highlighted with red boxes and numbered 1 through 3.

id.orig_h	count
10.0.0.25	22
10.0.0.46	20
10.0.0.48	20
10.0.0.21	19
10.0.0.22	19
10.0.0.24	17
10.0.0.33	17
10.0.0.18	16
10.0.0.16	15
10.0.0.30	15

Task 2: Find the Total Number of SSH Connections

SPL Query

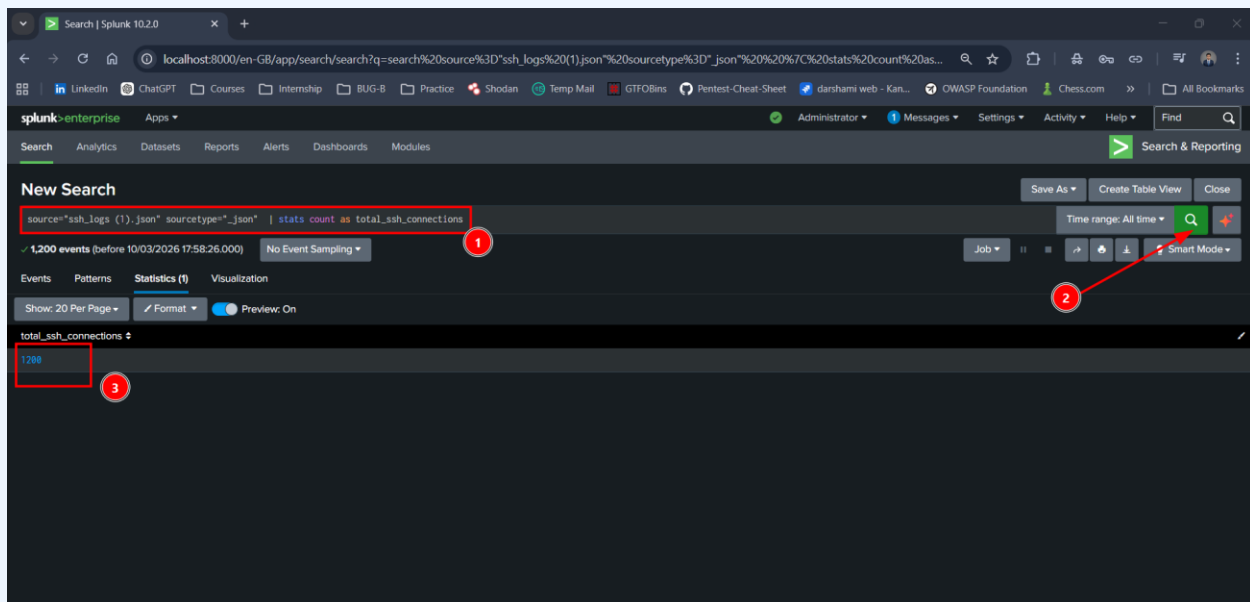

```
index=ssh_lab sourcetype="json"
| stats count as total_ssh_connections
```

Explanation

Command	Purpose
stats count	Counts all events
as total_ssh_connections	Renames the output field

What This Shows

This query provides the **total number of SSH connection events** recorded in the logs.

This helps understand **overall SSH activity** on the network.

Task 3: Count All Event Types in the Logs

SPL Query

```
index=ssh_lab sourcetype="json"
| stats count by event_type
```

Explanation

Command	Purpose
stats count by event_type	Groups events based on event type

Possible Event Types

Event Type	Meaning
successful	Successful SSH authentication
failed	Failed login attempt
no-auth	Connection attempt without authentication
multiple-failed	Multiple failed attempts from same source

The screenshot shows the Splunk Search interface. The search bar contains the query: `source="ssh_logs (1).json" sourcetype="json" | stats count by event_type`. The search results show 1,200 events. The 'Statistics (4)' tab is selected, displaying a table with the following data:

event_type	count
Connection Without Authentication	286
Failed SSH Login	305
Multiple Failed Authentication Attempts	303
Successful SSH Login	306

Red annotations in the image include: a box around the search query (1), a box around the 'Statistics (4)' tab (2), a box around the event_type column header (3), and a box around the count column header (4). Red arrows point from the event_type column to the event_type column header and from the count column to the count column header.

SECURITY INSIGHTS

Analyzing SSH logs can help detect:

1. **Brute Force Attacks:** Large numbers of **failed login attempts** from one IP.
2. **Unauthorized Access:** Unexpected **successful logins** from unknown IP addresses.
3. **Suspicious Login Patterns**

Examples:

- Many failed attempts followed by one successful login
- Logins at unusual times
- Connections from unfamiliar geographic locations

Splunk enables **real-time monitoring and threat detection** through log analysis.

CONCLUSION

In this lab we successfully:

- Uploaded **Zeek SSH logs into Splunk**
- Learned how Splunk processes **JSON log data**
- Used **SPL queries** to analyze SSH authentication activity

The analysis helped identify:

- Top IP addresses generating failed login attempts
- Total number of SSH connections
- Distribution of SSH event types

This type of log analysis is critical for **detecting brute force attacks, monitoring server access, and improving system security.**
